Profile

13 years of high-concurrency backend engineering, with the past year extended into **AI engineering** — where the first things I built were a convergence layer and cost controls, not another generator. Having maintained core transaction systems for years and led incident response on a large-scale outage, I know exactly what unreliable output costs once it reaches production.

Review ~50%↓ Maestro converging 4 AI review bots, 300+ PRs	¥10B+ GMV within 5 months, Apple China reseller platform	25s → 2s Critical API p99 after major-outage response
200% YoY growth, KKday affiliate business	40%↓ Incident triage time via VM Health Center	20+ Daily users of self-built AI platforms, 7 teams

- **AI engineering:** built a convergence layer for multiple AI review bots (Maestro) and an AI-assisted root-cause monitoring platform (VM Health Center), solving the practical problem of duplicated, unreliable, unconverged AI output
- **Engineering fundamentals:** 13 years of high-concurrency backend work (PHP / Go / Node.js), maintaining core transaction flows and leading major incident response — which is why I'm more careful than most before putting AI output in front of production traffic
- **Transaction-systems depth:** top contributor and owner of KKday's affiliate marketing platform (200% YoY growth), and owner of the B2C core transaction flow

AI Engineering

- **Maestro** (TypeScript CLI) — a **convergence layer for AI review bots**: orchestrates 4 bots (CodeRabbit, Copilot, Codex, Gemini) through classification, three-stage deduplication, auto-fix, thread replies and resolution, convergence monitoring and escalation. **Now part of the team's daily workflow:** 10 engineers, 300+ PRs processed; per the team's own assessment, review time **cut roughly in half** and false positives down about 70%
- **VM Health Center** (TypeScript/Node.js + Slack Bolt + Elasticsearch, built solo from scratch) — a team dashboard and service health monitor: aggregates Jira/GitHub/Confluence into daily/weekly reports, surfaces checkout-funnel and backend health alerts, with preliminary AI root-cause analysis (rule-based log-keyword matching narrows down 1–2 suspicious traces, then an LLM helps pinpoint the underlying issue). **Used daily by 20+ people across 7 teams** (Product, Web, App, QA, Order, B2C), firing alerts every day and cutting incident triage time by 40%
- **Claude API in production:** SEO slug generation across 8 locales covering nearly 3,000 product pages and ~50k API calls, with hash-based change detection skipping unchanged content to hold cost down; a Git workflow and AI code-review automation system deployable as CLI, webhook or GitHub Actions

Core Skills

AI Engineering	Claude API / Copilot SDK application development, multi-agent orchestration and convergence, AI-assisted engineering process design
Languages & Frameworks	PHP (expert, 8+ yrs), TypeScript / Node.js, Go (basic), Python (reading proficiency); Laravel / Hyperf, Vue

Data & Messaging

MySQL, PostgreSQL, Redis, Elasticsearch, Google BigQuery, RabbitMQ, Kafka

Cloud & DevOps

Docker, Kubernetes, AWS Lambda / GCP Cloud Run, GitHub Actions, Prometheus / Grafana / Kibana

Architecture & Domain

Microservices and BFF layering, RabbitMQ event-driven pipelines, Redis circuit breakers with two-tier kill switches, multi-tier caching and cache-key governance; commission settlement, order transaction flows, dynamic pricing

Experience

2022.11 – 2026.08
Shanghai, China
(UTC+8)

KKday | Senior Backend Engineer

A leading global travel-experience platform operating in 50+ countries. Progressed from affiliate platform owner → B2C core backend → owner of the Pre-Purchase Conversion Task Force (currently ~80% of my time, with the remaining 20% wrapping up and handing off the B2C core flow).

Pre-Purchase Conversion Task Force · Owner (2026 H2)

- Formed and lead a **6-person cross-platform team** (iOS/Android/Web/Backend) against a single north-star metric — conversion **1.2% → 1.8% (+50%)**; established standups, 1-on-1s and OKR alignment across the pre-purchase funnel (product page → cart → checkout), and built a CVR health-monitoring dashboard so results are visible and verifiable

B2C Core Transaction Flow (2025.02 – 2026.08)

- USJ (Universal Studios Japan) booking-date changes**: re-architected across four services, authoring **7** SA/SD documents. Turned scattered coupon and loyalty-point revalidation rules into an auditable decision table — approved by all four teams in a single review, securing renewal with a top-tier ticketing supplier
- Major outage response (as primary responder)**: traced the root cause to a microservice dependency exhausting the PHP-FPM worker pool and shipped P0+P1 hardening in **7** days (timeouts, fallbacks, a Redis circuit breaker, two-tier kill switch) — cart/validate p99 **25s+ → <2s**, iOS checkout white-screen eliminated, 5xx held below **0.01%** since

Affiliate Marketing Platform · Platform Owner (2022.11 – 2025.03)

- Top contributor and owner of two core services — affiliate-service (majority of all commits) and affiliate-api — as Code Owner and PR gatekeeper; integrated Google's Things To Do channel and **10+** partner channels including ShopBack, Asia Miles and Naver Shopping, growing the affiliate business **200%** YoY
- Designed the **commission settlement system**: rules engine, monthly settlement with re-run capability, BigQuery attribution, and a RabbitMQ event-driven pipeline connecting order and product data

2017.12 – 2022.10
Shanghai, China
(UTC+8)

Shopex | Technical Expert / Lead Developer

A leading domestic e-commerce and B2B MarTech/SCRM marketing-automation SaaS provider. Responsible for backend development across a marketing-automation microservice suite (Laravel/Yii2/YAF, 10+ services), and drove high-concurrency performance and stability work.

- Apple China reseller platform** (the platform surpassed **¥10B** GMV within 5 months of launch): personally owned the core flow — pre-order, checkout, payment callbacks, fulfilment and shipping —

leading a **6–7** person cross-functional team; integrated **15+** payment and logistics systems including SF Express and Baozun OMS, serving **3,500+** retail stores and **250K+** DAU

- Received the company's **Golden Tomato Award** for a high-performance coupon system; raised H5 API throughput **17.5× (200 → 3,500 TPS)** and reached **12K TPS** under load testing (NGINX caching + TSung tuning)
- Owned the **marketing event-tracking service**: omnichannel behavioral collection and content-marketing attribution, the primary data source for marketing automation
- Contributed to a front-/back-end separation rewrite (v2) and legacy-system maintenance (**300+** commits combined), while covering iteration and stability across **8+** microservices including EDM, an SMS gateway (built on go-zero, handling **1M+** messages/day), surveys and lead generation

2013.06 – 2017.12

Shanghai, China
(UTC+8)

Yuanfeng Technology Group | Full-Stack Engineer

- Built a multi-merchant SaaS e-commerce platform serving **10,000+** merchants with **10**-language support, using a hybrid Google/Youdao translation pipeline that cut translation costs **70%**
- Optimized data export from OOM failures to **10M rows in 10 minutes**

Open Source & Personal Projects

- **SwaggerNotes** (PHP/Laravel package, built solo): generates Swagger annotations and OpenAPI specification files; published on Packagist with **2.6k+** downloads
- **knuckleswtf/scribe** (**2.3k** ★ Laravel API documentation generator): **2** pull requests merged upstream, listed among official contributors
